

# ProblemSet 2 – Representations and characters

George McNinch

2024-01-29

In these exercises,  $G$  always denotes a finite group and all vector spaces are assumed to be finite dimensional over the field  $F = \mathbb{C}$ .

In these exercises, you may use results stated but not yet proved in class about characters of representations of  $G$ .

1. In this problem, we identify the character  $\chi_\Omega$  of the *permutation representation*  $(\rho, F[\Omega])$  of a group  $G$ .

- a. Let  $V$  be a vector space and let  $\Phi : V \rightarrow V$  a linear mapping. If  $\mathcal{B}$  is a basis for  $V$ , recall that the *trace* of  $\Phi$  is defined by

$$\text{tr}(\Phi) = \text{tr}([\Phi]_{\mathcal{B}}).$$

**apologies – this is just explanatory; it isn't actually a question**

- b. Recall that the *dual* of  $V$  is the vector space  $V^\vee = \text{Hom}_F(V, F)$  of *linear functionals* on  $V$ .

If  $b_1, \dots, b_n$  is a basis for  $V$ , let  $b_j^\vee : V \rightarrow F$  be defined by  $b_j^\vee(b_i) = \delta_{i,j}$ . Show that  $b_1^\vee, \dots, b_n^\vee$  is a basis for  $V^\vee$ ; it is known as the *dual basis* to  $b_1, \dots, b_n$ .

- c. Prove that the trace of the linear mapping  $\Phi : V \rightarrow V$  is given by the expression

$$\text{tr}(\Phi) = \sum_{i=1}^n b_i^\vee(\Phi(b_i)).$$

- d. Suppose that the finite group  $G$  acts on the finite set  $\Omega$ , and consider the corresponding permutation representation  $(\rho, F[\Omega])$  of  $G$ . Recall that  $F[\Omega]$  is the vector space of all  $F$ -valued functions on  $\Omega$ , and that for  $f \in F[\Omega]$  and  $g \in G$ , we have

$$\rho(g)f(\omega) = f(g^{-1}\omega).$$

In particular, we saw in the lecture that

$$\rho(g)\delta_\omega = \delta_{g\omega},$$

where  $\delta_\omega$  denotes the *Dirac function* at  $\omega \in \Omega$ .

Show that

$$\text{tr}(\rho(g)) = \#\{\omega \in \Omega \mid g\omega = \omega\};$$

i.e. the trace of  $\rho(g)$  is the number of fixed points of the action of  $g$  on  $\Omega$ .

2. Let  $V$  be a representation of  $G$ , suppose that  $W_1, W_2$  are invariant subspaces, and that  $V$  is the internal direct sum

$$V = W_1 \oplus W_2.$$

Show that the character  $\chi_V$  of  $V$  satisfies

$$\chi_V = \chi_{W_1} + \chi_{W_2}$$

i.e. for  $g \in G$  that

$$\chi_V(g) = \chi_{W_1}(g) + \chi_{W_2}(g).$$

3. Let  $G = A_4$  be the alternating group of order  $\frac{4!}{2} = 12$ .

We are going to find the *character table* of this group.

- a. Confirm that the following list gives a representative for each of the conjugacy classes of  $G$ :

$$1, (12)(34), (123), (124)$$

(Note that  $(123)$  and  $(124)$  are conjugate in  $S_4$ , but *not* in  $A_4$ ).

What are the *sizes* of the corresponding conjugacy classes?

- b. Let  $K = \langle (12)(34), (14)(23) \rangle$ . Show that  $K$  is a normal subgroup of index 3, so that  $G/K \simeq \mathbb{Z}/3\mathbb{Z}$ .

Let  $\zeta_3$  be a primitive 3rd root of unity in  $F^\times$  and for  $i = 0, 1, 2$  let  $\rho_i : G \rightarrow F^\times$  be the unique homomorphism with the following properties:

- i.  $\rho_i((123)) = \zeta^i$
- ii.  $K \subseteq \ker \rho_i$ .

Explain why  $\rho_0 = \mathbf{1}, \rho_1, \rho_2$  determine distinct irreducible (1-dimensional) representations of  $G$ .

- c. Let  $\Omega = \{1, 2, 3, 4\}$  on which  $G$  acts by the embedding  $A_4 \subset S_4$ .

Compute the character  $\chi_\Omega$  of the representation  $F[\Omega]$ . (This means: compute and list the values of  $\chi_\Omega$  at the conjugacy class representatives given in a.)

(Use the result of problem 1 above).

- d. The span of the vector  $\delta_1 + \delta_2 + \delta_3 + \delta_4 \in F[\Omega]$  is an invariant subspace isomorphic to the irreducible representation  $\rho_0$  (the so-called *trivial representation*).

Thus  $F[\Omega] = \rho_0 \oplus W$  for a 3-dimensional invariant subspace. Explain why problem 2 shows that the character of  $W$  is given by  $\chi_W = \chi_\Omega - \mathbf{1}$ .

Now prove that  $\langle \chi_W, \chi_W \rangle = 1$  and conclude that  $W$  is an irreducible representation.

- e. Explain why

$$\mathbf{1}, \rho_1, \rho_2, W$$

is a complete set of non-isomorphic irreducible representations of  $G$ .

- f. Display the *character table* of  $G = A_4$ .
